M9834A: 10 MHz to 20 GHz

M9837A: 10 MHz to 44 GHz

## Introduction

Characterizing sub-systems such as transmit/receive (T/R), or multiport front-end modules (FEM) is not easy. Requiring beyond just the standard S-parameter and noise figure measurements, these modules additionally need you to do high sensitivity and high-power performance characterization, as well as modulated signal tests such as EVM and ACPR. Juggling a network analyzer, signal analyzer, and a switch matrix not only takes up valuable time, but also introduces even more measurement complexity.

The M983xA PXIe vector network analyzer (VNA) combines all your measurements into a single instrument, enabling system characterization with faster speeds and greater flexibility, at a lower cost. The PXI's form factor scalability, built-in noise receivers, and configurable test set combined with modulated signal measurements allows you to characterize highly integrated components with a single connection. Easily perform RF measurements with software wizards to guide you through advanced wideband measurements.

# Definition

## Specification (spec)<sup>1</sup>

Warranted performance. Specifications include guardbands to account for the expected statistical performance distribution, measurement uncertainties, and changes in performance due to environmental conditions. All specifications and characteristics apply over a  $25\text{ °C} \pm 5\text{ °C}$  and relative humidity of 25 to 70% range (unless otherwise stated).

The following conditions must be met:

- Module temperature is between 40 to 53 °C.
- Instrument has been turned on for 90 minutes with VNA application running.
- Instrument is within its calibration cycle.
- Instrument remains at a stable surrounding environment temperature (between -10 °C to 55 °C) for 60 minutes prior to turn-on.

## Characteristics (char.)

A performance parameter that the product is expected to meet before it leaves the factory, but that is not verified in the field and is not covered by the product warranty. A characteristic includes the same guardbands as a specification.

## Typical (typ.)

Expected performance of an average unit at a stable temperature between  $25\text{ °C} \pm 5\text{ °C}$  for 60 minutes prior to turn-on and during operation; does not include guardbands. It is not covered by the product warranty. The instrument must be within its calibration cycle.

## Nominal (nom.)

A general, descriptive term or design parameter. It is not tested, and not covered by the product warranty.

## Supplemental Information

A performance parameter that is tested on sampled product during design validation. It does not include guardbands and is not covered by the product warranty.

## Calibration

The process of measuring known standards to characterize an instrument's systematic (repeatable) errors.

## Corrected (residual)

Indicates performance after error correction (calibration). It is determined by the quality of calibration standards and how well "known" they are, plus system repeatability, stability, and noise.

## Uncorrected (raw)

Indicates instrument performance without error correction. The uncorrected performance affects the stability of a calibration.

1. For all tables in this data sheet, the specified performance at the exact frequency of a break is the better value of the two specifications at that frequency.

# Dynamic Range

The specifications in this section apply to measurements made with the Keysight M983xA vector network analyzer under the following conditions:

- 10 Hz IF bandwidth
- No averaging applied to data
- Does not include crosstalk effects

1. Receiver dynamic range is defined as the typical test port 0.15 dB compression minus the typical noise floor.
2. It may typically be degraded at 25 MHz.

## Corrected System Performance

This section provides specifications for the corrected performance of the M983xA PXIe VNA using either of 85052D, 85056A, 85056D Mechanical Calibration Kit or N4691D, N4693D Electronic Calibration (ECal) Module. To determine transmission and reflection uncertainty curves with other calibration kits, please download the Uncertainty Calculator from [http://www.keysight.com/find/na\\_calculator](http://www.keysight.com/find/na_calculator) to generate the curves for your specific calibration kit.

Measured with 10 Hz IF bandwidth, no averaging applied to data. Measurement uncertainty values are achieved when the module has been stored for 48 hours in a stable environment and has been on for 24 hours prior to calibration. The average environmental humidity for 24 hours before and after calibration must be in the 25% to 70% range and have less than 5% deviation. The environmental temperature must be within 23 °C ± 3 °C, with less than 1 °C deviation from the calibration temperature. The calibration is valid for 24 hours.

1. Limited by 0.2 dB receiver compression. Applies to devices with bandwidth <400 MHz. For devices with higher bandwidths, calculate the DUT output noise power as  $-174 \text{ dBm} + 10 \cdot \log_{10}(B) + \text{Gain (dB)} + \text{NF (dB)}$ , where B is the bandwidth of the DUT in Hz, and use the Max Input Power specification.

## Dynamic Accuracy

Accuracy of the test port input power relative to the reference input power level. Measured with 10 Hz IF bandwidth.

### Dynamic accuracy <sup>1</sup> – specification

- Dynamic accuracy is verified with the following measurements:
  - Compression over frequency.
  - IF linearity using a reference level of -20 dBm for an input power range of 0 to -60 dBm. Tested at 999.6 MHz to cover the whole frequency range. The VNA receiver is linear by design when signal levels are below -60 dBm. For more details, refer to [VNA Receiver Dynamic Accuracy Specifications and Uncertainties](#).
- Download Uncertainty Calculator from [http://www.keysight.com/find/na\\_calculator](http://www.keysight.com/find/na_calculator) to generate the curves of dynamic accuracy.

# Spectrum Analysis (with Option 190 and S95090xB)

This section provides specifications for spectrum analysis with Option 190 of the M983xA Series PXIe VNA. The S95090B Software is required to enable spectrum analysis functionality of the M983xA.

Description	Specification
10 MHz to 20 GHz	± 0.1
20 GHz to 40 GHz	± 0.15
40 GHz to 44 GHz <sup>2</sup>	± 0.18

1. With 18 dB attenuation. SA detector accuracy is residual error of IF response calibration. IF response is characterized with M983xA's standard measurement class after power and S-parameter calibration. Therefore, the SA total absolute amplitude accuracy includes power meter, S-parameter and SA detector accuracies. Add input attenuation switching uncertainty if receiver attenuator is changed after user calibration.

2. Tested at the test ports (without low noise path), up to 43.99 GHz.

1. Tested with 15 dBm at 1 GHz, 3 GHz, or 10 GHz, 10 dBm at 20 GHz. Spurious signals are excluded. With the SA class, phase noise of VNA's source is equivalent to the receiver phase noise.
2. Tested at 19.99 GHz.

## Modulation Distortion Analysis (with Option 190 and S95070B)

This section provides specifications for modulation distortion analysis using Option 190 of the M983xA Series PXIe VNA and an external vector signal generator. The S95070B Software is required to enable modulation analysis functions of the M983xA. Refer to M983xA and M980xA PXIe VNA configuration guide (literature number: [5992-3597EN](#)) for the list of supported signal generators by this application.

Typical measured performance (EVM and ACPR) of a thru adapter and N4985A power amp is provided.

**Table 54. Frequency Range – Specifications**

Description	Specification
Frequency range <sup>1,2</sup>	100 MHz to 19.97 GHz (with M9834A) 100 MHz to 43.97 GHz <sup>3</sup> (with M9837A)

- Lower edge of modulated signal and upper edge of modulated signal should be within the frequency range.
- The lowest frequency is limited by the modulation source.
- For the carrier frequency above 41 GHz, an external bandpass filter or high-pass filter is required to avoid the measurement error due to LO leakage from the source port. Filters such as Marki P/N FH-4000 (for 41 GHz to 42 GHz) or Eravant P/N: SWF-45310360-2F2F-B1 (for 41 GHz to 43.5 GHz) are recommended. Two cascaded Keysight V281A waveguide adapters can be used as a high-pass filter for 42 GHz to 43.97 GHz.

**Table 55. Maximum Modulation Bandwidth <sup>1</sup> – Typical**

Description	Without Opt.D2E	With Opt.D2E
100 MHz to 31.8 GHz	2 GHz	2 GHz
31.8 GHz to 37 GHz	2 GHz	550 MHz
37 GHz to 44 GHz	2 GHz	2 GHz

- The maximum modulation bandwidth is limited by the modulation source. For example, the maximum bandwidth for modulation distortion analysis is 1.2 GHz when used with the M9410A VXT with option B12 (1.2 GHz analysis bandwidth). Use M9383A/B or M9384B for a 2 GHz bandwidth.

# Multi-module Measurements with S95551B Software

When the S95551B software is installed, the M983xA PXIe VNA has the ability to be configured into a multiport network analyzer with two M983xA modules. Adding a second module to the PXI chassis would provide additional test ports to configure a 4-port VNA. This configuration provides a full featured multiport vector network analyzer capability with full crossbar S-parameter measurement capability.

M980xA PXI VNA modules can be added to a multiport configuration as well. Multiport configurations using two M983xA modules and ten M980xA modules in a single PXI chassis (ex. maximum 24-port, 44 GHz configuration) have been evaluated.

For multi-module operation using two M983xA modules, all single-module specifications apply except trace noise, test port noise floor, system dynamic range, Displayed Average Noise Level (DANL) and SA detector accuracy. The other performance of multi-module configurations will meet the single-module specifications in the data sheet. The guidance provided here is given as general reference based on Keysight’s internal evaluation of multiport PXIe VNA configurations. Not all multiport setups using multiple PXIe VNAs are tested as a multiport instrument in the factory. Interconnect cables included in the Y1730A must be used for connection among multiple M983xA and M980xA modules. For more detail of multi-module configurations, refer to “M983xA Multi-module Installation Guide” at <http://www.keysight.com/find/m980xa-mm>.

**Table 60. Multi-module Performance**

- A check mark, ✓, indicates the performance parameter is the same as the corresponding single-module performance.
- An empty diamond, ◇, indicates that the performance parameter may be degraded as the number of modules increases.

Keysight IO library	The IO library suite offers a single entry point for connection to the most common instruments including AXIe, PXI, GPIB, USB, Ethernet/LAN, RS-232, and VXI test instrument from Keysight and other vendors. It automatically discovers interfaces, chassis, and instruments. The graphical user interface allows you to search for, verify, and update IVI instrument and soft front panel drivers for modular and traditional instruments. The IO suite safely installs in side-by-side mode with NI I/O software. Free software download at <a href="http://www.keysight.com/find/iosuite">www.keysight.com/find/iosuite</a>
Keysight soft front panel	The PXI module includes a soft front panel (SFP), a software based graphical user interface (GUI) which enables the instrument's capabilities from your PC.
Command Expert	Assists in finding the right instrument commands and setting correct parameters. A simple interface includes documentation, examples, syntax checking, command execution, and debug tools to build sequences for integration in Excel, MATLAB, LabVIEW, VEE, and System VUE.
