## Definition and Terms

**Specifications** describe the performance of parameters covered by the product warranty and apply to temperature ranges 0 to 55 °C, unless otherwise noted.

**95th percentile** values indicate the breadth of the population (approx.  $2\sigma$ ) of performance tolerances expected to be met in 95 percent of the cases with a 95 percent confidence, for any ambient temperature in the range of 20 to 30 °C. In addition to the statistical observations of a sample of instruments, these values include the effects of the uncertainties of external calibration references. These values are not warranted. These values are updated occasionally if a significant change in the statistically observed behavior of production instruments is observed.

**Typical** values (typ) describe additional product performance information that is not covered by the product warranty. It is performance beyond specifications that 80 percent of the units exhibit with a 95 percent confidence level over the temperature range 20 to 30 °C. Typical performance does not include measurement uncertainty.

**Nominal** values (nom) indicate expected performance or describe product performance that is useful in the application of the product but are not covered by the product warranty.

The analyzer will meet its specifications when:

- It is within its calibration cycle.
- Under auto couple control, except that Auto Sweep Time Rules = Accy
- For signal frequencies < 10 MHz, DC coupling applied.
- Analyzer is used in environment that falls within allowed operating range; and has been in that environment at least 2 hours before being turned on.
- Analyzer has been turned on at least 30 minutes with AutoAlign set to Normal; or, if Auto Align is set to Off or Partial, alignments must have been run recently enough to prevent an Alert message. Note that factory default is with the AutoAlign set to Light, which (compared to Normal) allows wider temperature changes before causing Alignments to run automatically. The benefit is that Alignments interrupt less frequently. The user can change AutoAlign to Normal if desired, and this setting will persist after power cycle or PRESET. If the Alert condition is changed from "Time and Temperature" to one of the disabled duration choices, the analyzer may fail to meet specifications without informing the user. In practice, the impact of such choices is primarily on Absolute Amplitude Accuracy. If temperature changes are small, the impact of Light vs Normal is negligible. Also, the user may invoke Align All at any time, to get the best possible accuracy.
- The term "mixer level" is used as a condition for many specifications in this document. This term is a conceptual quantity that is defined as follows: Mixer Level (dBm) = RF Input Power Level (dBm) - (Mechanical Attenuation) (dB) - (Electronic Attenuation) (dB).
- The term "attenuation" is used for many specifications in this document; this refers to the Mechanical Attenuator, unless otherwise stated.

## Amplitude Accuracy

Amplitude characteristics vary by user-selectable front-end path. Swept SA measurements are normally made with preselector on (in circuit). These settings impact amplitude accuracy and range.

Front end settings			
1a	Standard path	Preselector	Default selection following power-on, boot-up, or PRESET. Settings provide best dynamic range and lowest internally-generated distortion. Suitable for harmonics, IMD, spurious in presence of large signals, etc. unless noise-limited.
1b		Preselector, LNA on	Requires P08, P13, or P26. Settings provide lower DANL, compared to 1a, while preserving very good dynamic range. Suitable for distortion measurements (harmonics, IMD, etc.) when a lower noise floor is needed.
1c		Preselector, PA on	Requires P08, P13, or P26. Settings provide lower DANL, compared to 1b.
1d		Preselector, LNA on, PA on	Requires P08, P13, or P26. Settings provide lowest possible DANL, compared to 1c. Best for finding low-level spurs, oscillations, etc. near the noise floor. Allows use of wider RBW setting to achieve equivalent noise floors, so can make spur searching faster.
2a	Low-noise path (LNP)	Preselector, LNP	Settings provide the lowest distortion and best dynamic range, yet with lower DANL at higher frequencies, when compared with 1a. Path not active below 3.6 GHz.
2b		Preselector, LNP, LNA on	Requires P08, P13, or P26. Settings provide the lower DANL, compared to 2a, while preserving very good dynamic range. Path not active at below 3.6 GHz.
3a	Microwave Preselector Bypass path (MPB)	MPB	Settings provide very good EVM floor at mid-high input power region (using attenuation), including below 3.6 GHz. Good for wideband digitizer and FFT measurements. Recommend using path 4a if above 3.6 GHz.
3b		LNA on	Requires P08, P13, or P26. Settings provide best EVM at low input power for below 3.6 GHz. Good for wideband digitizer and FFT measurements. Otherwise use path 4b if above 3.6 GHz.
3c		PA on	Requires P08, P13, or P26. Good for wideband digitizer and FFT measurements. Settings allowed only for very low power levels since preselector is bypassed.
3d		LNA on, PA on	Requires P08, P13, or P26. Good for wideband digitizer and FFT measurements. Settings provide best EVM at very low power, including below 3.6 GHz
4a	Full Bypass path (FBP)	LNP, MPB	Settings provide best EVM floor for mid-high input power region (using attenuation) for above 3.6 GHz. Best for wideband digitizer and FFT measurements. Otherwise use path 3a if below 3.6 GHz.
4b		LNP, MPB, LNA on	Requires P08, P13, or P26. Settings provide best EVM floor for low input power region (using attenuation) for above 3.6 GHz. Best for wideband digitizer and FFT measurements. Otherwise use path 3b if below 3.6 GHz.

Noise Floor Extension (Option NF2) improves DANL by 9 to 11 dB, for standard path, LNA on, PA on.

Frequency	20 °C to 30 °C	Full range	Typical
< 20 MHz			Not permitted with LNA on
20 to 40 MHz			-164 dBm (nom) <sup>1</sup>
40 to 500 MHz	-165 dBm <sup>1</sup>	-165 dBm <sup>1</sup>	-167 dBm <sup>1</sup>
500 MHz to 2.5 GHz	-165 dBm <sup>1</sup>	-165 dBm <sup>1</sup>	-167 dBm <sup>1</sup>
2.5 to 3.6 GHz	-161 dBm <sup>1</sup>	-161 dBm <sup>1</sup>	-166 dBm <sup>1</sup>
3.6 to 8.4 GHz	-165 dBm	-164 dBm	-167 dBm
8.4 to 13.5 GHz	-164 dBm	-163 dBm	-167 dBm
13.5 to 17.1 GHz	-163 dBm	-161 dBm	-166 dBm
17.1 to 23 GHz	-163 dBm	-161 dBm	-165 dBm
23 to 26.5 GHz	-160 dBm	-158 dBm	-163 dBm

## 2a. Low-noise path (low-noise path enabled, preselector on, LNA off, PA off)

Noise Floor Extension (Option NF2) improves DANL by 9 to 12 dB, for low-noise path.

Frequency	20 °C to 30 °C	Full range	Typical
< 3.6 GHz			Not permitted with low noise path
3.6 to 17.1 GHz	-153 dBm	-151 dBm	-155 dBm
17.1 to 23 GHz	-151 dBm	-149 dBm	-154 dBm
23 to 26.5 GHz	-150 dBm	-148 dBm	-153 dBm

1. In the range 20 MHz to 3.6 GHz, when both LNA and PA are set to on, only the LNA is actually in circuit. Therefore, DANL is similar to 1b in this frequency range.

It is possible, but not common, to make swept SA measurements with preselector by-passed. The impact to DANL and TOI is estimated here, relative to comparable paths with preselector.

- DANL for MPB is ~4 dB better than Standard (1a in table).
- DANL for MPB, PA on is ~3 dB worse than Standard, PA on (1c in table).

## Wide-Bandwidth IQ Analysis (Demod)

Several wide-bandwidth IF paths and digitizers are available to acquire IQ data, with LO tuning fixed (not swept), typically to characterize the modulation quality of intentional transmitters (e.g. EVM).

All specifications based on preselector by-passed (RF Path either Microwave Preselector Bypass or Full Bypass) (except <3.6 GHz), unless otherwise noted.

## 5G NR EVM Residuals (“Floor”) vs Power (“Bathtub Curves”)

Example measurement results are demonstrations of performance (not specifications). EVM residual plots include contributions from the signal generator; the N9032B signal analyzer alone would have lower residuals (by ~3 dB, if assume equal contributions).
